

## GRENADE RIFLE No. 24

This grenade was a development of the No. 20 Mk2 modified so as to simplify production and economise in materials. It was introduced in June 1917 and declared obsolete in July 1920.

The grenade was marked with coloured band to indicate the type of filling thus:

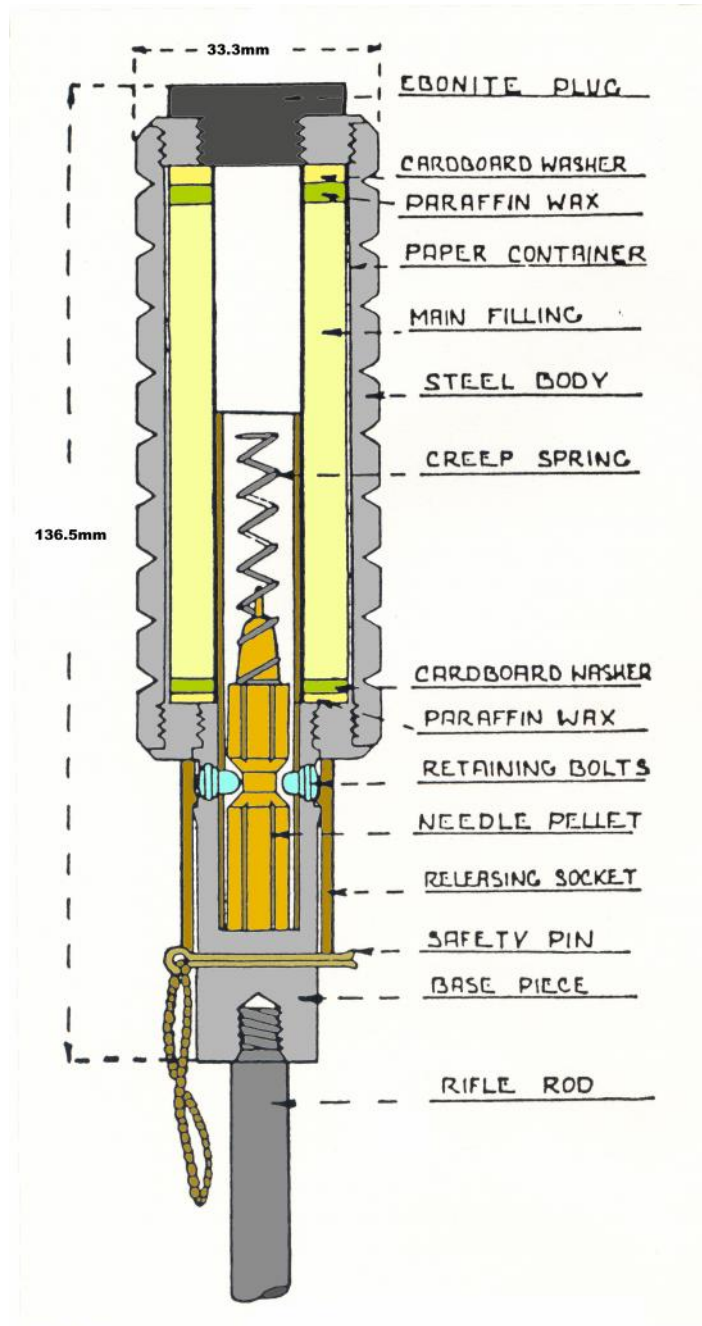

Green = Amatol filling

Pink = Alumaton or Ammonal filling.

Mk I = Had a serrated steel body.

Mk II = Had a plain cast iron body

**Action.**

Remove the ebonite plug and place a detonator in the recess above the creep spring and replace the plug. Place the grenade rod in the muzzle of the rifle and remove the safety pin. On firing the releasing socket sets back freeing the retaining bolts that fly clear. This frees the needle pellet to move forward on impact driving the striker needle into the detonator, the detonation of this passes into the main filling.
